AX / FDE · SELECTED EXPERIENCE

Turning ambiguous business needs into working systems

I learn how teams work, identify bottlenecks, and connect the people, data, and tools needed to solve them. My work spans renewable-energy operations, reporting automation, feasibility assessment, and AUDPlatform workflows for sales opportunities, contracts, orders, and weekly meetings.

RENEWABLE ENERGY | WORKFLOW AUTOMATION | SYSTEM INTEGRATION

01 / Operations monitoring

Consolidated data from multiple monitoring systems and made inverter-level status available through a web interface and Telegram.

02 / Reporting automation

Connected scheduled requests with response parsing and database ingestion to automate recurring reporting work.

03 / Preliminary feasibility assessment

Turned a broad request for address-based assessment into a service by learning the business workflow and integrating external data and financial analysis.

I use AI to support implementation and review, then validate results myself and with business users. I build and improve AUDPlatform workflows for sales opportunities, contracts, orders, and weekly meetings. I also take ownership of unfamiliar tasks, including an in-progress company website and explanatory videos, learning the tools needed to deliver them.
